

## A small piece of great innovation

sangrip® solves stacking problems the smart way:

- prevents slipping
- quick and easy to use
- simple to apply
- economic and durable
- saves time and money
- in a handy dispenser
- food-safe
- impervious to moisture
- 100% recyclable

## The gripping solution

For stacking, transport and storage: The sangrip® non-slip strip provides amazing grip for anything that might slide on its own.

The strip fits and sits perfectly wherever grip is required: between smooth surfaces and uneven edges. Every strip is surprisingly light and easy to use – saving time and unnecessary packaging materials.

A minor application for a major effect – sangrip® prevents unstable items from slipping during transport: simply and quickly.

## Just the right setting for your packages!

With sangrip® you have the assistant you've always been looking for. So why has nobody thought of it before, you may ask? Just because the best ideas need a perfect basis. With its innovative features, sangrip® shows how easy progress can be:

- Mixed polymer film
- available in various widths
- perforated for easy separation
- dynamic friction coefficient (film-cardboard)  $\geq 0.7$

## ... sangrip® stops things slipping!

With sangrip® you can stack them as high as you like – even with difficult routes and packages. A small strip with a great effect:

- + The safety benefit: high, smooth stacks of parcels are no longer a potential danger.
- + The time benefit: fast and easy to use.
- + The quality benefit: products remain in perfect shape without damage from slipping.
- + The environmental benefit: the need for wasteful packaging materials is reduced.

sangrip® and sanstrap® stretchbands are the ideal combination for all internal transport and logistics activities.

## On a slippery slope ...

Smooth surfaces, unevenly sized parcels and sloping routes in the warehouse:

Transport conditions like these offer great potential for slipping. Products and materials that are not securely stowed can get damaged. Transportation becomes a risk for goods and people. Complex safety procedures in internal logistics are no solution since they are costly and time-consuming. But without a solution valuable products start to slide, people's safety is at risk and deadlines slip too.
